“Planning the Urban Forest”

Why we need larger and healthier trees

San Diego Chapter
American Planning Association
October 18, 2013

Robin Y. Rivet: robin.rivet@sandiegotreemap.org
ISA Certified Arborist- WE-7558A

What is Urban Forestry?

- Why does it matter?
- Where to get information?
- What has gone wrong?
- How can we improve?

This is a nice place...
BUT DIFFICULT TO RETROFIT FOR MOST CITIES

It's
NOT
just
about
trees...

graveyards

golf courses

SAN DIEGO URBAN FOREST

- Watersheds
- Schoolyards
- Private homes
- Streets and alleys
- Places of worship
- Government lands
- Beaches and dunes
- Commercial business

orchards

flower fields

The legal “definition” from California code

PUBLIC RESOURCES CODE SECTION 4799.06-4799.12

4799.09. As used in this chapter the following terms have the following meanings:

(c) "**Urban forestry**" means the cultivation and management of native or introduced trees and related vegetation in urban areas for their present and potential contribution to the economic, physiological, sociological, and ecological well-being of urban society.

(d) "Urban forest" means those native or introduced trees and related vegetation in the urban and near-urban areas, including, but not limited to, urban watersheds, soils and related habitats, street trees, park trees, residential trees, natural riparian habitats, and trees on other private and public properties.

The Urban Forestry Act was passed in 1978, OPR page launched 2012

Urban Forestry Act (PRC 4799)

Is this message reaching stakeholders?

HOME STATE CLEARINGHOUSE CEQA CHANGE LOCAL GOVT.

Urban Forestry

Trees and the urban forest provide a variety of important benefits in the urban environment. Environmental benefits include removing carbon from the atmosphere, reducing energy use, improving air quality, moderating stormwater flows, protecting water quality, improving economic sustainability, and providing habitat for wildlife. In addition to the health benefits realized through the protection and promotion of the environment, trees and urban forests also support the physical and mental health of residents. The urban forest can play a role in meeting carbon reduction mandates required by the Global Warming Solutions Act of 2006. In short, trees can improve the environment, health, and quality of life in our urban environments where Californians live, work, and play.

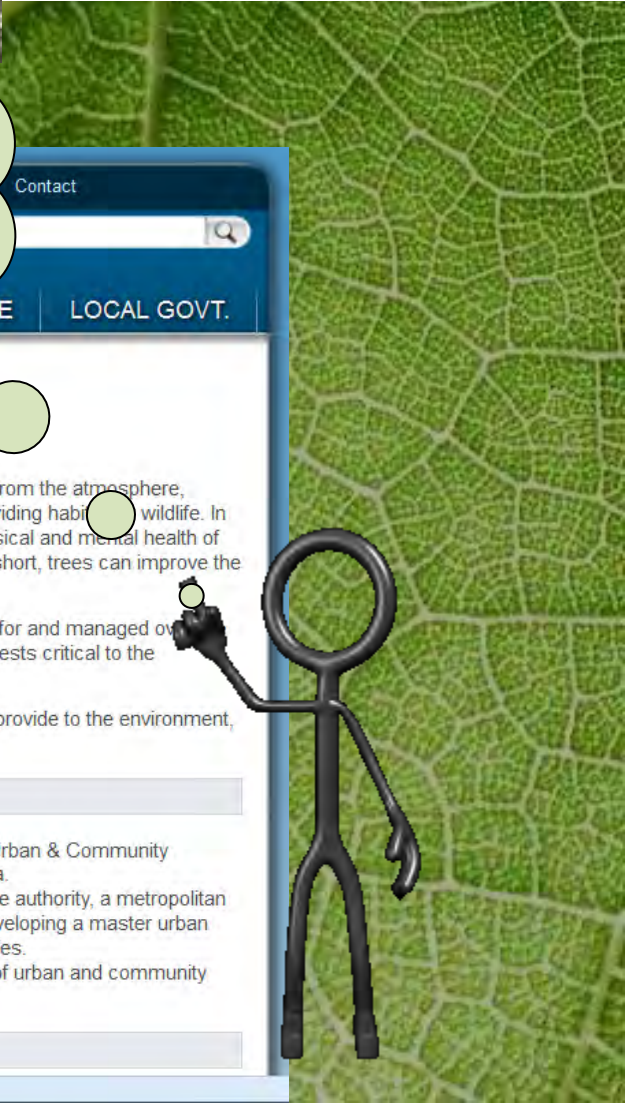

In order to establish and maintain the stream of benefits potentially provided by an urban forest, a community's trees need to be well planned for and managed over the long term. Unlike most other urban infrastructure, the value of the urban forest generally increases over time. Not only are trees and urban forests critical to the community's economic well-being and overall quality of life, but they are an important strategy for addressing chronic disease and obesity.

OPR provides the following information for local governments to plan for a healthy urban forest that optimizes the benefits urban forests can provide to the environment, public health, economy, and more.

STATE AND FEDERAL GOVERNMENT PROGRAMS AND GRANTS

- CAL FIRE Urban Forestry Program, Regional Staff, and Grants:** Under the authority of the [California Urban Forestry Act of 1978](#), the Urban & Community Forestry Program works to expand and improve the management of trees and related vegetation in communities throughout California.
- Strategic Growth Council Urban Greening Grants:** These grants fund public jurisdictions (including council of governments, countywide authority, a metropolitan planning organization, local government, nonprofit organization, special district, or joint powers authorities) and nonprofit entities in developing a master urban greening plan that will ultimately result in projects to help the State meet its environmental goals and the creation of healthy communities.
- USDA Forest Service Urban and Community Forestry:** The Forest Service supports projects and research related to a diverse array of urban and community forestry issues.

RESOURCES FOR LOCAL GOVERNMENTS

American Forests Urban Ecosystem Analysis conducted over six years in ten select cities

An estimated 634,407,719 trees are currently missing
from metropolitan areas across the United States –

National Urban Tree Deficit

In 1986, the National Urban and Community Forest Advisory Council conducted a 20-city survey to understand the condition of the nation's street trees.

The first, "State of Our City Forests" (American Forests Magazine June, 1986) reported that urban forests in all the cities were in decline, with the average city losing 4 trees for every one planted.

$$1 + (-4) = -3$$

USDA Forest Service

Urban Forest Health: Identifying Issues and Needs
within the Northeastern Area

USDA Forest Service Report

- Urban trees reach maximum potential for environmental benefits after age 30, but the average life-span of a downtown urban tree is less than 10 years.
- **Most cities are removing more trees than they are planting.**
- 37% percent of cities practice "crisis management" – responding to accidents, impending hazards, and complaints rather than implementing a systematic tree maintenance program.

i-Tree software were developed by this team*

Center for Urban Forest Research

Tree Guidelines for Coastal Southern California Communities - January 2000

What did this study do?

It evaluated 100 sampled trees and compared costs to benefits

It concluded the average temperature in urban areas rose 1 degree every decade over the past 50 years.

It is estimated that future effects of global warming may double this rate.

It evaluated the rate of CO₂ emissions from power plants in Southern California and found SDG&E, LADWP & SCE were ~11% higher than the state average.

The bottom line: Many more trees are needed to help sequester all that carbon

Table A4. Estimated 40-year total benefits and costs for the City of Buena Vista street tree planting (100 trees).

Benefits	50 Large Trees		30 Medium Trees		20 Small Trees		100 Trees	Total
	Res units	\$	Res units	\$	Res units	\$	Res units	\$

The Case for Public Tree Inventories

- Many San Diego County cities have outsourced tree pruning and maintenance to private companies - who then offer to include an inventory of city trees as part of their contract.
- **Too often this results in the fox guarding the hen house.**

Sample view of existing canopy for an assessment and potential tree planting locations.

Appendix 13. Proposed tree planting locations for future east end commercial study area.

Source Data

San Diego
COUNTY TREES

Home of the San Diego County tree map

Why create a public tree map online?

- Tree canopy is being lost at an alarming rate
- Municipalities are overwhelmed and under-funded
- Minimal awareness about ecosystem values
- Tree identification is made easier for everyone
- Increased citizen engagement
 - Educational opportunities
 - Encourages philanthropy
 - Fruit and nut tree sharing services

Tree-mapping is fun!

The San Diego County Tree Map derived its algorithms from i-Tree Streets (original called STRATUM)

i-Tree Eco: a method to integrate data w/hourly pollution & meteorology

- **i-Tree Streets:** energy, water, carbon, air quality, real estate value
- **i-Tree Hydro:** effects of trees and impervious cover on hydrology
- **i-Tree Vue:** USDA – uses National Land Cover Data – Uses ESRI Viewer
- **i-Tree Design:** simple tree by tree analysis
- **i-Tree Canopy:** conduct your own canopy assessment
- **i-Tree Species:** index values for 1,600 tree species
- **i-Tree Pest and disease detection:** evaluate corridors of problems
- **i-Tree Utilities:** monitor trees under power lines
- **i-Tree Storm:** assess for damage assessment after a storm

This is i-Tree - It has many applications and features.

U.S. Forest Service Guide to
Assessing Urban Forests

*A Guide to Assessing
Urban Forests*

What is i-Tree?

i-Tree is a state-of-the-art, peer-reviewed software suite from the USDA Forest Service that provides urban forestry analysis and benefits assessment tools. The i-Tree Tools help communities of all sizes to strengthen their urban forest management and advocacy efforts by quantifying the structure of community trees and the environmental services that trees provide.

Trees - Important to Human Health

- 100 trees remove 12 tons of CO₂/year
- 100 trees remove 505 lbs of pollutants per year, including:
 - 139 lbs of ozone
 - 207 lbs of particulates

Trees - A Savings for Homeowners

- Save up to 34% of annual air conditioning costs
- Reduce outside temperatures by up to 5⁰ F

McPherson, E.G., J.R. Simpson, P.J. Peper, K.I. Scott, and Q. Xiao. 2000. *Tree guidelines for coastal Southern California communities*. Sacramento, CA: Local Government Commission. 98.

Trees trap more of the sun's energy than any other group of organisms on earth. Only 0.1% of the sun's energy is trapped by organisms. **Trees account for 50% of all that energy.**

It is not just a human instinct to seek shade on a hot day

Flash Movie

Trees are so effective at using solar radiation for energy, the science of bio-mimicry has copied trees to design collectors

Solar Shade Control Act CA PUBLIC RESOURCES CODE SECTION 25980-25986

Under this law, property owners are prohibited from allowing their trees or shrubs to shade more than 10% of a neighbor's solar energy system between the hours of 10am and 2pm.

**Any tree or shrub planted before
the installation of the solar collector is exempt.**

If a pre-existing tree dies, its replacement is also exempt, even if the replacement is planted after the solar collector's installation. The law also exempts trees and shrubs planted on timberland or commercial agricultural land.

Yearly Eco Impact

Selected trees in this region

- Total Benefits: \$5,722,837/year
- Greenhouse Gas Benefits: 22,301,702 lbs CO2 reduced / \$446,034/year
- Water Benefits: \$8,958,387 gallons conserved / \$101,167/year
- Energy Benefits: 10,880,255 kWh conserved / \$1,841,166/year
- Air Quality Benefits: \$4,387 lbs pollutants removed / \$7,424,408/year

What are cities
doing so
wrong?

Almost everything!

Can you see the difference?

More effort is needed to monitor nursery quality and site inspections

Lack of oversight at the municipal level results in increased maintenance costs and short-lived trees.

Observe
Carefully

Is this
good
planning
or NOT?

Does your street look similar?

Continued decline of city street trees and the alarming statistic –
The average life of a downtown street tree is just 13 years.

This is a nursery-topped specimen, and they're typical everywhere.

**It's not as good
as it looked
at first glance - is it?**

This type of be-heading causes irreparable damage; and significantly shortens the vigor, health and life of trees.

Did you know this violates CA codes?

DO NOT TOP TREES!

*Topping trees is now addressed in the California Public resources code
CAL. GOV. CODE § 53067 : California Code - Section 53067y*

© Jack H. Barger/U.S. Forest Service

An elm-lined street in Detroit in 1971 (top), and the same view in 1984 after a Dutch elm disease pandemic.

**We need to
select
tree species
more wisely**

- Monoculture may be aesthetic to some, but it's not very wise.
- The few remaining American Elm trees were usually solitary specimens.

UFEI is an excellent California site for tree selection

Rethinking Native Tree Selections

(many are not drought tolerant or street-friendly choices)

Riparian trees

In Riparian areas (Native streamside and moist habitats)
Some of our native San Diego trees include:

California Sycamore (*Platanus racemosa*)

White Alder (*Alnus rhombifolia*)

Fremont Cottonwood (*Populus fremontii*)

Arroyo Willow (*Salix lasiolepis*)

California Fan Palm (*Washingtonia filifera*)

Native palms are happiest in washes – not on pavement

However, palms are NOT actually trees, they are members of the "grass" family

Some California native trees are well adapted,
but the definition of a San Diego “native tree” is fuzzy.

Desert Willow

Coast Live Oak

Is a Torrey Pine native to El Cajon, or is a Redbud native to Coronado?

**Non-native trees are often better adapted to our urban environment,
than so called “native trees”**

This is partly a result of our changing climate, and our lack of indigenous trees. Our higher elevation native trees are not adapted to coastal regions.

Nursery Quality is Critical for long-lived, low maintenance urban trees

Preventive structural pruning the first 3-5 years of a tree's life,
reduces long-term and expensive corrective pruning later

Small container sizes are generally healthier

1 gallon –
or less is best

5 gallon is good

15 gallon may sulk

Large boxed trees may bolster the economy, but seldom the client

Urban Tree Foundation – Tree non-profit in Visalia, CA

Strategies for Growing a High-Quality Root System, Trunk, and Crown in a Container Nursery

Companion publication to the *Guideline Specifications for Nursery Tree Quality*

helpful tips for healthier city trees

D. Roots

1. The uppermost roots or root collar (root crown) shall be within the upper 2 inches of the soil media (substrate).
2. The root collar and the inside portion of the root ball shall be free of defects, including circling, kinked, and stem girdling roots. Soil removal near the root collar may be necessary to inspect the aforementioned root defects.

Desirable

Not Desirable

3. Roots on the periphery and bottom of the root ball shall be less than 1/4 inch in diameter (1/8 inch is preferred). The maximum acceptable root diameter on the periphery should be indicated.

Desirable

Not Desirable

Modern arboricultural planting guidelines
are not incorporated into old city codes
Don't dig a deep hole, dig a wide one.

Not only is it better for the tree, it's a lot easier too...

What amendments are the best to use when planting trees?

NONE OF THEM

Stakes work best if you don't use them...

Image credit: Andrew Koeser, International Society of Arboriculture, Bugwood.org

A tale of two Liquidambar

but why are they growing so differently?

What makes one tree valuable, and another one a nuisance?

*Pssst....
There's lots of secrets,
but probably not what you're thinking.*

The amazing thing
is they're growing right next door
to each other...

Surface roots are NOT always the tree's fault

Tree irrigation
should be adjusted
outward as tree
roots grow

Photo: Gerald Holmes, Valent USA Corporation, Bugwood.org

**Trees need infrequent deep watering.
Surface watering invites shallow root development.**

Do you recall learning about how tree roots - mirror their canopies?

Like this?

Or this?

IT WAS WRONG!

Roots want to spread wide - not deep

Remember where the roots should be?

Even if large box trees live, they seldom thrive

The science is changing, and too fast for most municipal codes.

**If you'd like to read more about this subject,
Landscape Architect James Urban wrote an excellent volume about
trees, soils and nursery stock.*

Landscape architects

- Have pressure to create instant effects
- They are primarily designers, often lacking horticultural knowledge
- Often follow outdated municipal codes - without questioning them

Nurseryman

- The bottom line is selling what customers want
- An unwary public still seeks out “lollipops”
- Root pruning is a new concept, but it clearly affects tree longevity

The State of San Diego County Trees

**American Forest
Urban Ecosystem Analysis
July 2003 report
Between 1985 and 2002
the San Diego Region**

Lost 29% of its tree cover!

Things Have Worsened Since Then

Just over 100 years ago
Balboa Park didn't have many trees...

Photo by Meredith French

This was San Diego circa 1904 - without many trees at all.
Kate Sessions was instrumental in celebrating
the first **Arbor Day** at City Park, later known as **Balboa Park**.

California Municipal Forest Health Threat Assessment

July 2012

*Report cards and recommendations
for 30 California municipal forests*

How stable is your city forest?

What are the chief health threats?

How can you prevent them?

**Few San Diego parks have any tree inventories,
but ANY San Diego county tree can be entered in our tree map.**

1. Carlsbad
2. Chula Vista
3. Coronado
4. Del Mar
5. El Cajon
6. Encinitas
7. Imperial Beach
8. La Mesa
9. Oceanside
10. Poway
11. San Diego
12. Santee
13. Solana Beach
14. Vista

San Diego is considered a **HOT SPOT** in the California Floristic Province

It is a dubious honor...

To qualify as a hotspot,

a region must meet two strict criteria:

1. It must contain at least 1,500 species of vascular plants (> 0.5 % of the world's total)
2. **It has to have lost at least 70% of its original habitat.**

Goals established for the San Diego Region July 2003 report - American Forests

An aerial photograph of a city, likely San Diego, showing a grid of streets, buildings, and a river. A black stick figure is positioned in the lower-left corner of the image, pointing its right hand towards the city. A thought bubble originates from the stick figure's head, containing the text 'These goals are attainable!'.

These
goals are
attainable!

25% tree canopy overall
30% suburban residential
20% urban residential
10% central business
districts

Our region's cities are hurting financially.
Tree planting and preservation are a low priorities.
Code compliance is nearly non-existent.
Oversight staff are laid off everywhere.

No Investment, No Return.

Estimates today are that our tree canopy hovers precariously between 4%-8%

Why don't I get more respect?

What can urban planners do to help?

1. **Advocate an updated canopy assessment**
2. Chart trees into the tree map to bolster awareness about ecosystem values
3. **Re-think tree species selection**
4. Specify nursery quality and INSPECTION
5. **Mandate oversight in planting and early pruning to save money and encourage longer-lived trees**

**It's a good thing trees fight back,
but they also need our help.**

photo by Graham Horn

Urban Forestry - it does matter!

And thanks for adding new trees into our map!
